

1. Add a third option in app header "Pre order" which is used for pre orders, but it can show exactly the same screen as with the "Delivery" option. The delivery time and date can anyways set up in the checkout.

2. Add at green homescreen reviews a star and number of reviews (e.g. ★ 4.0 (10))

3. Can we change the design of the way that restaurants are shown on the homescreen? Like in the screenshot, so the picture very large and under it the categories, delivery time and reviews as overlay on the picture (like you already did).

4. We also would like to have kind of a news slider on the top which kind of replaces the featured slider where we can for example show new restaurants or also add short blog posts. It should be similar like in the Bolt app. (see screen recording) Probably we can use the normal wordpress blog post function in order to add new posts and write articles.

5. Can we add a filter function on the homescreen? Similar as it already is on the explore page. But there should be just the possibility to filter the restaurants by rating, distance and minimum order value. Can you also adjust the filter on the explore page to this criterion?

6. Can we add a text like "open" or "closed" to the red and green points at the homescreen? Just next to the point.

7. Can we remove the button to call the restaurant, which is at each restaurant page?

8. Can we add a screen, which forces the user to create an account or login with google, etc. if he starts the app for the first time? (see screenshot) Can we add Login with Facebook and Apple Account?

9. At the checkout there is there is the text "this order is going to be delivered to:" Can we add here a button or text which allows the user to change the address again? So if he clicks on it, the map appears again, he can set his address new and after that it returns to the checkout. This function is that the user could correct his address if he set it probably wrong.

10. Can we add the payment method "Sofort", it allows user to pay via direct online payouts from their bank accounts. Stripe supports this payment method. Is it very time consuming to implement this?

Bugs:

1. Error if you try to login with Google after you selected your google account.

2. The search bar at the home screen is still not completely visible, it's cuted. (tested it on a galaxy S10+)
